Advanced Topics in Image Understanding - SS13

1. Repetition
2. Feature Space
3. Classification

- SIFT keypoints:
 - unknown number of points
- SIFT descriptors:
 - gradient location (4 x 4 grid)
 - gradient orientation (8 bins)
 - $4 * 4 * 8 = 128$ dimensional descriptor

- Bag of Words dictionary/vocabulary
 - all descriptors from the training dataset are clustered by a K-Means algorithm
- creation of histograms for each cluster
 - ...each filled with the keypoints of their respective cluster

- now the histograms represent our feature vectors
- Support-Vector-Machine training
 - the currently trained class will always be marked as positive, everything else as negative
 - this enables a 1-vs-all classifier

- Input Image
 - search for the best separation of the histogram of our test image in regard to the existing classes

Thank you
for your attention.
